

SYLF

Dual-Platform Advertiser Approval System

Gavan Quimby, Aiden Ly, Mason Natalini, Alex Ferguson

Advisor: Alan Peslak, PhD

BACKGROUND

SYLF began when founder Keyser Leepier built a fully functional minimum viable product within one year in 2023. He started by building the first dispenser in his basement, maxing out his credit cards and teaching himself everything from user interface design to React Native. By late October 2023, the dispenser was fully built, and in March 2024, the first drink was officially poured. The entire build cost under fifteen thousand dollars and took less than a year. Today, SYLF is preparing to bring its self-service cocktail and hard seltzer dispensers to venues across the region. In January 2026, Keyser reached out to Penn State Scranton for help creating a dual platform web service where companies can create campaigns and pay for their advertising materials to be displayed on different screens at specified times. Our job was to create the platforms for creating and approving the campaigns so that the pricing algorithm calculated the cost of a campaign, SYLF employees could organize the campaigns, and there was a seamless transition between approval and screen implementation.

OBJECTIVES

- Create a website for alcoholic beverage brands to be able to submit advertisements to be reviewed by SYLF to then be sent to machines. (Ad Studio)
- Create a website for SYLF employees to access submitted advertisements to review and decide to accept or reject ad campaigns. (Ad Manager)

PROCESS

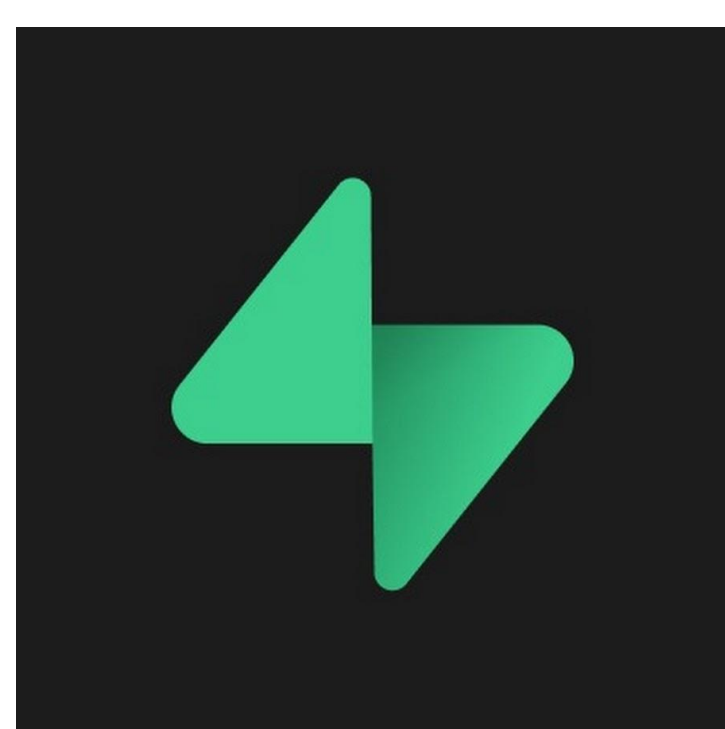

The work done was through personal development through Microsoft Visual Studio. Keyser Provided 2 App platforms, AD Studio and Ad Manager from GitHub.

Through personal development and the assistance of new **VibeCoding** practices, we were able to sync our changes with the database which was hosted under Supabase.

Once changes were finalized, we would push the changes to a GitHub Repository under a title to always be able to return to a previous backup in case of any failure.

SUPABASE IMPLEMENTATION

Supabase is the database that SYLF uses to house the campaigns and data tied to the websites (logins, settings, etc.). Using Visual Studio Code tied with Codex, a programming AI assistant, we were able to tie the data inputs from the websites to Supabase using APIs and Keys.

Supabase also pushes out the data housed to the websites depending on locations of machines and campaigns that are already submitted, approved, denied or ended.
